FOR YOUR SAFETY - READ BEFORE OPERATING

- If you do not follow these instructions exactly, a fire or explosion may result, causing property damage, personal injury or loss of life.

- Improper installation, adjustment, alteration, service or maintenance can cause property damage, personal injury or death. Installation and service must be performed by a qualified installer, service agency or the gas supplier.

- Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this heater or other appliances.

WHAT TO DO IF YOU SMELL GAS

- Do not try to light any appliance.
- Do not touch any electrical switch; do not use any phone in your building.
- Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instructions.
- If you cannot reach your gas supplier, call the fire department.

For additional free copies of this manual; call (800) 831-7133.

HEATER IDENTIFICATION INFORMATION

H. I. N.
HEATER IDENTIFICATION NUMBER
ID DESIGNATOR FOR PENTAIR POOL & SPA HEATERS

- HTR = HEATER
- 400 = MODEL SIZE
- NT = NATURAL GAS
- STD = STANDARD MODE
- NH = CANADIAN UNIT
- ASHI = ASME CERTIFIED
- HALT = HIGH ALTITUDE RATED
- CAN = CANADIAN UNIT
- CANH = CANADIAN HIGH ALTITUDE
- WCRD = WITH 6 FT CORD - DSI 100 ONLY

- BLANK = STANDARD MODEL
- ASME = ASME CERTIFIED
- ASHI = ASME CERTIFIED AND HIGH ALTITUDE RATED
- HALT = HIGH ALTITUDE RATED
- CAN = CANADIAN UNIT
- CANH = CANADIAN HIGH ALTITUDE
- WCRD = WITH 6 FT CORD - DSI 100 ONLY

- H = HOT SURFACE IGNITION
- N = NATURAL GAS
- P = PROPANE GAS
- STD = NON LOW NOX
- NT = MINIMAX NT SERIES

- MODEL SIZE = BTU INPUT in 1000 of BTU / HR
Congratulations on your purchase of a MiniMax NT high performance heating system. Proper installation and service of your new heating system and correct chemical maintenance of the water will ensure years of enjoyment. The MiniMax NT is a compact, lightweight, efficient, induced-draft, gas fired high performance pool and spa heater that can be directly connected to schedule 40 PVC pipe. The MiniMax NT also comes equipped with the Pentair multifunction temperature controller which shows, at a glance, the proper functioning of the heater. All HSI (hot-surface ignition) MiniMax NT heaters are designed with a direct ignition device (HSI) which eliminates the need for a standing pilot. The MiniMax NT requires an external power source (120/240 VAC 60 Hz) to operate.

IMPORTANT NOTICES

...For the installer and operator of the MiniMax NT pool and spa heater. The manufacturer’s warranty may be void if, for any reason, the heater is improperly installed and/or operated. Be sure to follow the instructions set forth in this manual. If you need any more information, or if you have any questions regarding to this pool heater, please contact Pentair Pool Products, Inc. at (800) 831-7133.

These heaters are designed for the heating of swimming pools and spas, and should never be employed for use as space heating boilers, general purpose water heaters, in non-stationary installations, or for the heating of salt water.

CAUTION

OPERATING THIS HEATER CONTINUOUSLY AT WATER TEMPERATURE BELOW 68° F. WILL CAUSE HARMFUL CONDENSATION AND WILL DAMAGE THE HEATER AND WILL VOID THE WARRANTY.

Do not use the heater to protect pools or spas from freezing if the final maintenance temperature desired is below 68° F. as this will cause condensation related problems.

CODE REQUIREMENTS

The installation must conform with local codes or, in the absence of local codes, with the National Fuel Gas Code, ANSI Z223.1/NFPA 54 and/or CSA B149.1, Natural Gas and Propane Installation Codes. If an external electrical source is utilized, the heater, when installed, must be electrically grounded and bonded in accordance with local codes or, in the absence of local codes, in the USA, with the National Electrical Code, ANSI/NFPA 7; in Canada, with Canadian Electric Code, CSA C22.1-98.
This instruction manual provides operating instructions, installation and service information for the MiniMax NT high performance heater. The information in this manual applies to all MiniMax NT models.

It is very important that the owner/installer read and understand the section covering installation instructions, and recognize the local and state codes before installing the MiniMax NT. History and experience has shown that most heater damage is caused by improper installation practices.

SAFETY RULES

1. Spa or hot tub water temperatures should never exceed 104°F. A temperature of 100°F is considered safe for a healthy adult. Special caution is suggested for young children.

2. Drinking of alcoholic beverages before or during spa or hot tub use can cause drowsiness which could lead to unconsciousness and subsequently result in drowning.

3. Pregnant women beware! Soaking in water above 100°F can cause fetal damage during the first three months of pregnancy (resulting in the birth of a brain-damaged or deformed child). Pregnant women should stick to the 100°F maximum rule.

4. Before entering the spa or hot tub, the user should check the water temperature with an accurate thermometer. Spa or hot tub thermostats may err in regulating water temperatures by as much as 4°F.

5. Persons with a medical history of heart disease, circulatory problems, diabetes or blood pressure problems should obtain their physician's advice before using spas or hot tubs.

6. Persons taking medication which induce drowsiness, such as tranquilizers, antihistamines or anticoagulants should not use spas or hot tubs.

WARNING

Should overheating occur or the gas supply fail to shut off, turn off the manual gas control valve to the heater. Do not use this heater if any part has been under water. Immediately call a qualified service technician to inspect the heater and to replace any part of control system and gas control which has been under water.

WARRANTY INFORMATION

The MiniMax NT pool heater is sold with a limited factory warranty. Specific details are described on the back cover of this manual and a copy of the warranty and warranty registration card are included with the product. Return the warranty registration card after filling in the serial number from the rating plate inside the heater.

Pentair Pool Products' high standards of excellence include a policy of continuous product improvement resulting in your state-of-the-art heater. We reserve the right to make improvements which change the specifications of the heater without incurring an obligation to update the current heater equipment.
FOR YOUR SAFETY: READ BEFORE LIGHTING

WARNING

If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or loss of life.

Do not attempt to light the heater if you suspect a natural gas leak. Lighting the heater can result in a fire or explosion which can cause personal injury, death, and property damage.

A. This appliance does not have a pilot. It is equipped with an ignition device which automatically lights the burners. Do not try to light the burners by hand.

B. BEFORE OPERATING, smell all around the appliance area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor.

WHAT TO DO IF YOU SMELL GAS
- Do not try to light any appliance.
- Do not touch any electrical switch; do not use any phone in your building.
- Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instructions.
- If you cannot reach your gas supplier, call the Fire Department.

C. Use only your hand to push in or turn the gas control knob. Never use tools. If the knob will not push in or turn by hand, don't try to repair it, call a qualified service technician. Forced or attempted repair may result in a fire or explosion.

D. Do not use this appliance if any part has been under water. Immediately call a qualified service technician to inspect the appliance and to replace any part of the control system and any gas control which has been under water.

STOP! Read the safety information above.

1. Turn off electric power to the heater.
2. Set the thermostat to the lowest setting.
3. This appliance is equipped with an ignition device which automatically lights the burners. Do not try to light the burners by hand.
4. Remove the control access door.
5. Push in gas control knob slightly and turn clockwise to "OFF".
6. Wait five (5) minutes to clear out any gas. If you then smell gas, STOP! Follow "B" in the safety information above. If you don't smell gas, go to the next step.

OPERATING INSTRUCTIONS

1. Turn gas control knob counterclockwise to “ON”. See Figure 1.
2. Replace the control access door.
3. Set the thermostat to the desired setting.
4. Turn on the electrical power to the appliance.
5. If the appliance will not operate, follow the instructions "To Turn Off Gas To Appliance" and call your service technician or gas supplier.

TO TURN OFF GAS TO APPLIANCE

1. Turn off all electric power to the appliance if service is to be performed.
2. Set the thermostat to lowest setting.
3. Remove control access door.
4. Push in gas control knob slightly and turn clockwise to "OFF". Do not force.
5. Replace control access door.
Installation Instructions

SPECIFICATIONS

IMPORTANT NOTICE: These installation instructions are designed for use by qualified personnel only, trained especially for installation of this type of heating equipment and related components. Some states require installation and repair by licensed personnel. If this applies in your state, be sure your contractor bears the appropriate license. See Figure 2 for Outdoor and Figure 3 for Indoor Ventilation.

OUTDOOR VENTILATION

INDOOR VENTILATION

DIMENSIONS IN INCHES
ELECTRICAL, for MiniMax NT Heaters

Electrical Rating 60 Hz 120 / 240 Volts AC, single phase

NOTE

• The MiniMax NT heater is prewired for 240 volt AC connection using the “RED/BROWN” female connector and the “WHITE” common male connector; see below, Figure 4. If you require the heater to be connected to 120 volts AC, remove the “RED/BROWN” female connector from the “WHITE” common connector; now locate the “BLUE” female connector and plug it into the “WHITE” common connector. When connecting the home wiring to the “Line Terminal Block” inside the junction box, follow the polarity as shown below. Connecting to 120 VAC, make sure that you connect the positive wire to the positive terminal (L), the neutral wire is connected to the neutral terminal (N) and the ground is connected to the ground terminal (GND); see below, Figure 5.

• If any of the original wiring supplied with this heater must be replaced, installer must supply (No. 18 AWG, 600V, 105° C. U.L. approved AWM low energy stranded) copper wire or it’s equivalent. Thermal fuse wiring must be replaced with 18 AWG, 600V, 150° C temp. rating. Interconnecting wiring to appliance must conform to the National Electrical Code or supercede local (wiring) codes.

WARNING

The installation must conform with local codes or, in the absence of local codes, with the National Fuel Gas Code, ANSI Z223.1/NFPA 54 and/or CSA B149.1, Natural Gas and Propane Installation Codes. If an external electrical source is utilized, the heater, when installed, must be electrically grounded and bonded in accordance with local codes or, in the absence of local codes, in the USA, with the National Electrical Code, ANSI/NFPA 7; in Canada, with Canadian Electric Code, CSA C22.1-98.

• Always use crimp type connectors when connecting two wires.

You might need to open the jacket (upper panel) for servicing the Line Terminal Block as shown in Figures 4 & 5.
WIRING SCHEMATIC FOR ALL DUAL VOLTAGE BLOWERS

120 VOLTS AC

- WHITE → LINE # 1
- YELLOW → JOINED
- ORANGE → JOINED
- BLACK → LINE # 2
- PURPLE
- BROWN
- BROWN = CAPACITOR

240 VOLTS AC

- WHITE → LINE # 1
- YELLOW → CAP OFF
- ORANGE → JOINED
- BLACK → JOINED
- PURPLE → LINE # 2
- BROWN
- BROWN
- BROWN = CAPACITOR

NOTE FOR TEST OF THE BLOWER:

1. In reference to the above terms, "CAP OFF" means to no connection.

2. The term "JOINED" means the two wires are connected together and no external connection.
NOTE: When connecting a remote control to the MiniMax NT Heater, you must install the low voltage thermostat wires in separate conduit from ANY line voltage wires. Failure to follow these instructions will cause the thermostat relay to react erratically.
**OPERATING (CONTROLS)**

### Dual Temperature Control System

For convenience and economy all MiniMax NT Heaters are equipped with two thermostats on the front of the heater control panel; see Figure 8.

![Thermostat Knob Stopper Diagram](image)

**THERMOSTAT KNOB STOPPER**

Each thermostat is equipped with a mechanical stop that can be locked or unlocked with use of a screwdriver to prevent temperatures in excess of that desired by the user; see Figure 9.

The maximum setting can be adjusted by loosening the screw "A" and turning the stopper dial to desired maximum setting. Lock the setting by tightening the screw. The Mechanical stop is under the knob. Ensure that the knob is stopping at the correct position when the knob is rotated clockwise from a lower temperature position. (See Thermostat Adjustment.)

**NOTE**

To eliminate error due to piping heat losses, measure pool temperature with an accurate thermometer directly at the pool or spa.

### THERMOSTAT ADJUSTMENT

The knob with locking feature eliminates the need for constant thermostat adjustments. Set the knob pointer to the desired pool or spa temperature.

If further adjustment is needed, rotate the knob until the desired temperature is obtained. This knob position corresponding to your desired maximum pool or spa temperature may now be preset (locked) by the knob stopper which prevents the knob from being turned beyond the maximum temperature you set.

![Thermostat Adjustment Diagram](image)

### POWER (THERMOSTAT SELECT) SWITCH

The Pool/Off/Spa switch allows the heater to be turned off when heating is not desired.

1. “Pool” position - Maintains selected pool temperature.
2. “Off” position - Heater will not come on regardless of drop in pool or spa temperature.
3. “Spa” position - This allows separate control of spa water temperature.

### INDICATOR LIGHT DESCRIPTION

The MiniMax NT Heater provides nine status indicator lights, six can be seen from the front of the control panel which help you understand the operation of the heater. If something should go wrong, the lights will aid in troubleshooting the problem. Three additional lights can be seen after opening the control panel. These three lights give the service technician advanced troubleshooting capability. All the LED lights are green with the exception of the red service LED.

#### POWER LIGHT (POWER)

The light is on at all times, in any switch position, indicating 24 VAC power is being supplied to the control circuit. If it fails to light, no other light will be on. Possible causes are:

a) external power to the heater is disconnected, check service panel circuit breaker or fuses; b) local circuit breaker inside the transformer has tripped -- investigate cause before resetting; c) transformer has failed.

#### THERMOSTAT (TSTAT)

This light is on when the thermostat contacts close, signaled by the water temperature falling below the setpoint, calling for the heater to fire to maintain the desired water temperature.

#### AUXILIARY (AUX)

This light is on when it indicates the remote switch contacts are closed. This allows you to observe if your remote switch is properly closing the heater control circuit. When shipped from the factory a jumper is installed to maintain closed circuit in the absence of a remote switch.

#### PRESSURE (PRESS)

This light is on when Spa/Pool Selector switch is on, indicates the circulation pump is running properly. If pressure light fails to light, the pump may have lost its prime or water flow may be restricted by an inadvertently closed valve or clogged filter or pump basket. If you have determined that there is no water flow restriction to the heater, you should call a qualified serviceman.
HEAT (HEAT)
The heat light is on any time the thermostat has signaled a call for heat which initializes the ignition safety firing circuit -- the light comes on to indicate successful firing of the main burners.

SERVICE (SERVICE)
The service light is off during normal operation of heater. The light only comes on if a problem with a control has occurred or when the heater is first firing. The problem must be investigated by a qualified service technician prior to attempts to fire the heater again.

The diagrams that follow give examples of troubleshooting a malfunctioning heater using the assistance of the indicator lights.

TROUBLESHOOTING (CONTROLS)

Example of troubleshooting with the assistance of the indicator lights.

PLUMBING CONNECTIONS

The MiniMax NT heater has the unique capability of direct schedule 40 PVC plumbing connections. A set of bulkhead fittings is included with the MiniMax NT to insure conformity with Pentair’s recommended PVC plumbing procedure. Other plumbing connections can be used. See Figure 10 for plumbing connections.

**CAUTION**

Before operating the heater on a new installation, turn on the circulation pump and bleed all the air from the filter using the air relief valve on top of the filter. Water should flow freely through the heater.

Do not operate the heater unless water in the pool/spa is at the proper level.

PLUMBING VALVES

When any equipment is located below the surface of the pool or spa, valves should be placed in the circulation piping system to isolate the equipment from the pool or spa. Check valves are recommended to prevent back siphon.

**CAUTION**

Exercise care when installing chemical feeders so as to not allow back siphoning of chemical into the heater, filters or pump. When chemical feeders are installed in the circulation of the piping system, make sure the feeder outlet line is down stream of the heater, and is equipped with a positive seal noncorrosive “Check Valve”, (P/N R172288), between the feeder and heater.

**MANUAL BY-PASS**

Where the flow rate exceeds the maximum 120 GPM, a manual bypass should be installed and adjusted. After adjustments are made, the valve handle should be removed to avoid tampering.

<table>
<thead>
<tr>

<td>30</td>
<td>120</td>
</tr>
<tr>
<td>400</td>
<td>40</td>
<td>120</td>
</tr>
</tbody>
</table>

* Do not exceed the maximum recommended flow rate for the connecting piping.

See Page 25, Figure 21.

BELOW POOL INSTALLATION

If the heater is below water level, the pressure switch must be adjusted. This adjustment must be done by a qualified service technician. See following CAUTION before installation.

**CAUTION**

BELOW OR ABOVE POOL INSTALLATION

The water pressure switch is set in the factory at 1½ PSI. This setting is for a heater installed at pool level or within 3’ above or 3’ below. If the heater is to be installed more than 3’ above or 3’ below, the water pressure switch must be adjusted by a qualified service technician.

**FLOW SWITCH**

If the heater is installed more the 6’ above the pool or more than 10’ below the pool level, you will be beyond the limits of the pressure switch and a flow switch must be installed. Locate and install the flow switch externally on the outlet piping from the heater, as close as possible to the heater. Connect the flow switch wires in place of the water pressure switch wires.
WATER CONNECTIONS

Reversible Inlet/Outlet Connection
The MiniMax NT heater is factory assembled with right side inlet/outlet water connections. The inlet/outlet header can be reversed for left side water connections without removing the heat exchanger.

Reversing Water Connections
Tools required:
- 1/4 in. Screw Driver
- 9/16 in. Socket and Wrench
- 1/2 in. & 9/16 in. Open Wrench

1. Remove the right and left large inspection plates.
2. Disconnect all wires from the high-limit switches except the short jumper wire.
3. Disconnect the pressure switch wiring.
4. Remove the temperature sensing bulb from the inlet/outlet header. Note: If needed, you may cut the wire ties holding them together.
5. Remove the 16 bolts holding the main inlet/outlet head and return head in place, exchange the heads, using the new tube seals supplied with the heater, re-install the 16 bolts using moderate torque.
6. Install the temperature sensing probe by passing the wires through the hole provided on the left side of the brace panel. Route wires through the support bracket.
7. Reconnect all the high limit wires and the pressure switch wiring, routing the wires through the same hole as the thermostat sensor wires.
8. Re-install the two large inspection plates on the appropriate side.

NOTE
There is no reason to remove the high-limit and pressure switches or the thermister from the front header during the reversing procedure, as they will be in the proper location when installed on the left side.

INSULATING THE HIGH LIMITS

When Reversing Heads on the MiniMax NT Heater
On the MiniMax NT heater there is insulation installed by the factory on the return head side of the heaters. This insulation is there so that if the heads are reversed in the field, during initial installation of the heater, the reflected heat from the flue collector will be insulated from the high limits.
GAS CONNECTIONS

GAS LINE INSTALLATIONS

Before installing the gas line, be sure to check which gas the heater has been designed to burn. This is important because different types of gas require different gas pipe sizes. The rating plate on the heater will indicate which gas the heater is designed to burn. Tables 1-3, shown on page 18, shows which size pipe is required for the distance from the gas meter to the heater. The table is for natural gas at a specific gravity of .65 and propane at a specific gravity of 1.5.

When sizing gas lines, calculate three (3) additional feet of straight pipe for every elbow used.

When installing the gas line, avoid getting dirt, grease or other foreign material in the pipe as this may cause damage to the gas valve, which may result in heater failure.

The gas meter should be checked to make sure that it will supply enough gas to the heater and any other appliances that may be used on the same meter.

The gas line from the meter will usually be of a larger size than the gas valve supplied with the heater. Therefore a reduction of the connecting gas pipe will be necessary. Make this reduction as close to the heater as possible.

The heater and any other gas appliances must be disconnected from the gas supply piping system during any pressure testing on that system, (greater than ½ PSIG).

The heater and its gas connection must be leak tested before placing the heater in operation. Do not use flame to test the gas line. Use soapy water or another nonflammable method.

A manual main shut-off valve must be installed externally to the heater.

WARNING

DO NOT INSTALL THE GAS LINE UNION INSIDE THE HEATER CABINET. THIS WILL VOID YOUR WARRANTY.

SEDIMENT TRAPS

Install a sediment in front of the gas controls. The sediment trap shall be either a tee fitting with a capped nipple in the bottom outlet which can be removed for cleaning, as illustrated in Figure 11, or a other device recognized as an effective sediment trap. All gas piping should be tested after installation in accordance with local codes.

Figure 11.
REGULATED MANIFOLD PRESSURE TEST

1. Attach the manometer to the heater jacket.
2. Shut off the main gas valve.
3. Remove 1/8 in. NPT plug on the outlet side of the valve and screw in the fitting from the manometer kit. See Figure 12.
4. Connect the manometer hose to the fitting.
5. Turn on the heater.
6. The manometer must read 4 in. WC for natural gas or 11 in. WC for propane, while operating.
7. For adjustment, remove the Regulator Adjustment Cap and using a screwdriver turn the screw clockwise to increase - counterclockwise to decrease gas pressure.

⚠️ CAUTION

The use of Flexible Connectors (FLEX) is NOT recommended as they cause high gas pressure drops.

PROPANE 2 STAGE REGULATION

In many “RESIDENTIAL” Propane gas line installations, the gas supplier and or installer will utilize a two stage regulation process where by at the supply tank they will install the first stage gas regulator, which would be at a higher pressure, usually 10 psi and can be for longer distance and in a smaller pipe size. Then within a short distance from the heater they will install a second regulator, which is the second stage, and this would be set at the required inlet pressure of 11 inches of W.C. for all the Pentair Pool Heaters.

*All Readings are taken with the heater fired. Any adjustments or readings made with heater off will give incorrect readings.

** 6 in. WC for 400 model
INDOOR VENTING—General Requirements

The vent pipe must be the same size or larger. The MiniMax NT heaters are capable of a 360-degree discharge rotation and operate with a positive vent static pressure and with a vent gas temperature less than 400° F.

*Please note the allowable vent runs for each stack pipe diameter are different and can not be exceeded. The total length of the horizontal run must not exceed the length that is listed below in the tables.*

Note that each 90-degree elbow reduces the maximum horizontal vent run by 8 feet and each 45-degree elbow in the vent run reduces the maximum vent run by 4 feet. See the tables below for the maximum vent lengths using a 90-degree and 45-degree elbows.

The MiniMax NT is a “Category III” Appliance and is an induced-draft pool and spa heater which uses positive pressure to push flue gases through the vent pipe to the outside. This requires a completely sealed vent system—single wall vent pipe with sealed-seams and joints. *Flue gases under positive pressure may escape into the dwelling with any cracks or loose joints in the vent pipe, or improper vent installation.* The vent pipe must be of a sealed-seam construction such as those listed for use with “Category III Appliances” and for operating temperatures above 350°. The use of listed thimbles, roof jacks and/or side vent terminals are required; and the proper clearances to combustible materials must be maintained in accordance with type of vent pipe employed—in the absence of a clearance recommendation by the vent pipe manufacturer, the requirements of the Uniform Mechanical Code should be met. *The ventilation air requirements for the MiniMax NT heater can be found on page 21.* It is recommended that vent runs over 18 feet be insulated to reduce condensation related problems and/or the use of a condensate trap in the vent run close to the heater may be necessary in certain installations such as cold climates. The MiniMax NT is suitable for through-the-wall venting, see table and dimensions below.

Recommended sources for Side-wall vent hood terminals include: The Field Controls Co. (2308 Airport Road, Kingston, NC 28501, (800)742-8368) and Tjernlund Products Inc. (1601 Ninth Street, White Bear Lake, MN 55110, (800) 255-4208)—consult manufacturer for model information and availability.

---

### CAUTION

Do NOT combine exhaust vent pipes to a common exhaust vent in multiple unit installations. Run separate vent pipes.

INDOOR INSTALLATION (USA ONLY)
OUTDOOR SHELTER INSTALLATION (CANADA)

See page 21 for (Indoor) Vent Adaptors

All products of combustion and vent gases must be completely removed to the outside atmosphere through a vent pipe which is connected to the stack adaptor. A vent pipe extension of the same size must be connected to the indoor stack adaptor and extended at least 2 feet higher than highest point of the roof within a 10 foot horizontal radius, and at least 3 feet higher than the point at which it passes through the roof, or as permitted by local code; see Figures 13, 14 and Detail “H” of Figure 18. The vent should terminate with an approved vent cap (weather cap) for protection against rain or blockage by snow.

The heater must be located as close as practical to a chimney or gas vent.

CAUTION

The heater should be installed at least 5 feet away from the pool or spa.

The heater must be placed in a suitable room on a non-combustible floor or on a non-combustible base and in an area where leakage from heat exchanger or water connections will not result in damage to the area adjacent to the heater or the structure. When such locations cannot be avoided, it is recommended that a suitable drain pan with adequate drainage, be installed under the heater. The pan must not restrict air flow.

Installations in basements, garages, or underground structures where flammable liquids may be stored must have the heater elevated 18 inches from the floor using a non-combustible base. The following minimum clearances from combustible materials must be provided.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Ceiling Clearance</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>18 in</td>
</tr>
</tbody>
</table>

*To ceiling or roof.

The heater should not be installed closer than 6 inches to any fences, walls or shrubs at any side or back, nor closer than 18 inches at the plumbing side. A minimum clearance of 24 inches must be maintained at the front of the heater.
Installation (Indoor)

NOTES
- The heater requires two uninterrupted air supply openings; one for ventilation and one to supply air for proper gas combustion. The air supply openings should be sized according to Table 4.
- The openings listed in Table 4 are free open vent area—if the vents incorporate restrictive louvers, the vent openings must be increased to compensate for the area blocked by the louvers (or grills).

Air supply requirements below apply to all MiniMax NT heaters

Table 4.

INSTALLATION ON FLOORS CONSTRUCTED OF COMBUSTIBLE MATERIALS

The heater may be placed on a “combustible floor” using either of the two methods listed below:

a) Use Listed Factory Non-combustible Base Kit for use on combustible floors.

b) Construct a non-combustible base from masonry blocks as illustrated, see Figure 16.

CAUTION
Chemicals should not be stored near the heater installation. Combustion air can be contaminated by corrosive chemical fumes which can void the warranty.

INDOOR VENT ADAPTORS (ALL MODELS)
The proper draft hood and adapter must be installed on the heater as shown below and on pages 19 and 20:

Figure 17.
**INDOOR INSTALLATIONS**

**MINIMAX NT VENTING GUIDELINES**

**Air Supply**

- **Vent for roof penetration installations:**
  - must use a double-wall vent pipe through the roof penetration.
  - must have the same diameter as the vent connector.
  - must be suitable for use with category III appliances (which have flue gas temperatures of less than 400 deg. F.).
  - may use a single wall vent pipe with permanently sealed seams and joints.

- **Vent for side wall installations:**
  - must be at least 3 ft. above any outside air intake located within a 10 ft. radius.
  - must be at least 1 ft. above grade.
  - must be located the following distances away from any door, window, or gravity air inlet:
    - 4 ft. below
    - 2 ft. horizontally
    - 1 ft. above

- **Vent termination for side wall installations:**
  - must use a double-wall vent pipe through the roof penetration.
  - must be located at least 24" above any object within 10 ft.
  - must terminate with an approved (listed) roof jack, storm collar, and vent/weather cap.

- **Vent pipe extension:**
  - must be at least 3 ft. higher than the point at which it passes through the roof, or as permitted by local code.

---

**Figure 18.**

Recommended sources for side wall vent hood; see page 17, Section Venting.
VENTILATION

OUTDOOR INSTALLATION ONLY (Outdoor Shelter Installation in Canada, see page 20)

For outdoor installation with an exhaust grill, the heater must be placed in a suitable area on a level, noncombustible surface. Do not install the heater under an overhang with clearances less than 3 feet from the top of the heater. The area under an overhang must be open on three sides.

IMPORTANT!

• For an outdoor installation it is important to ensure water is diverted from overhanging eves with a proper gutter/drainage system. The heater must be set on a level foundation for proper drainage.

• When locating the heater, consider that high winds can roll over or deflect off adjacent buildings and walls. Normally, placing the heater at least three feet from any wall will minimize downdraft.

Maintain minimum clearances as indicated below. Install a minimum of 4 feet below, and 4 feet horizontally from any opening to a building, see Figure 19.

Figure 19.

Vent Termination:

★ Must be not less than 7 ft. above public walkways.

A Must be at least 3 ft. above any forced air inlet located within a 10 ft. radius.

★ Must be located the following distances away from any door, window, or gravity air inlet:
    B 4 ft. below, or
    C 4 ft. horizontally, or
    D 1 ft. above

Check local building codes for setback requirements.
GENERAL DESCRIPTION

The MiniMax NT Pool and Spa Heater is a fan-assisted induced draft appliance. The MiniMax NT is available in 200,000, 250,000, 300,000 and 400,000 btu/hr. capacities and are certified for both indoor and outdoor installations.

The MiniMax NT is designed to operate both in stackless outdoor installations or with indoor stack vent installations—the indoor installation may be made using Kit 460506 or 460507; see pages 7 and 21, vertical vent pipe or with a horizontal vent pipe and a Listed side-wall vent.

BASIC SYSTEM OPERATION

TO OPERATE HEATER

1. Start pump, make sure the pump is running and is primed, to close water pressure switch and supply power to heater.
2. Set thermostat to lowest setting.
3. Set the thermostat rocker switch to the center “OFF” position.
4. Open the access doors. Set power switch to “OFF”.
5. Push in the gas control knob slightly and turn the knob clockwise to “OFF”.
6. Wait (5) minutes to clear out any gas. If you then smell gas STOP. Follow the safety information (stated earlier in the lighting instructions section). If you don’t smell gas, go to the next step.
7. Turn the knob on the gas control counter clockwise to the “ON” position and set power switch to “ON”.
8. Replace the doors.
9. Push the thermostat select switch to “POOL” or “SPA” to start the heater.
10. Set the thermostat to the desired temperature.
   a. Fan motor starts, which closes Vacuum Air Pressure (fan) switch.
   b. Ignition module is energized and the pre-purge cycle is started approximately 15 seconds.
   c. Check for powering up the (glow coil) hot-surface ignitor by viewing through the opening holes on the face plate.
11. The ignitor will warm up and then gas valve opens to ignite the main burners.
12. Heater will operate until desired temperature is reached.
SAFETY CONTROLS

VACUUM AIR PRESSURE (FAN) SWITCH

The air pressure switch is a safety device used to insure that the combustion air blower (fan) is operating and has been designed to monitor the vacuum (negative) pressure within the blower housing. The air pressures switch is factory set and is connected upstream of the ignition module. The ignition module does not operate unless the air pressure switch and all safety switches are closed.

![Typical Vacuum Air Pressure (Fan) Switch](image)

WATER PRESSURE SWITCH

The water pressure switch closes when there is a sufficient flow of water to the heat exchanger to safely operate the heater. The switch has been preset by the Factory at 1 PSIG for operation. **NOTE:** See, Below Pool Level Installation instructions on page 15. The switch may remain closed with no water flow if there is more than a 3 feet elevation difference between the heater (heat exchanger) and the pool water line—if this is the case, the water pressure switch must be reset by a qualified service technician to maintain open switch contacts with no water flow.

**NOTE**

If the pool is more than one floor above or one floor below the heater, the pressure switch may have to be replaced with a flow switch.
SAFETY CONTROLS, (cont’d.)

IGNITION MODULE
The Ignition Module is microprocessor based and operates on 24 VAC supplied by the transformer. The control utilizes a microprocessor to continually and safely monitor, analyze, and control the proper operation of the gas burners. The module with the presence of the flame sensor, using flame rectification, allows the heater to operate.

HIGH LIMITS
A “High Limit”, is a safety device that opens the electrical circuit and shuts off the heater based on a water temperature set point within the “High Limit Device”. The MiniMax NT series of heaters contains two (2) high limit devices which are located on the main inlet / outlet header, one sensing the inlet water temperature and one sensing the outlet water temperature.

OPERATION OF IGNITION MODULE

HEAT MODE
• When a call for heat is received from the thermostat supplying 24 VAC to the module terminal, the control will perform a self check routine and begins the safety timing ignition sequence. After the fan pre-purge cycle, the hot surface ignitor is activated for a heat-up period followed by energization of the gas valve for the trial for ignition period.
• When flame is detected during the trial for ignition, the ignitor is deactivated and the gas valve remains energized. The thermostat and main burner flame are constantly monitored to assure the system continues to operate properly. When the thermostat is satisfied and the demand for heat ends, the main valve is de-energized immediately followed by a fan post purge cycle.

FAILURE TO LIGHT LOCK OUT
Should the main burners fail to light, or flame is not detected during the trial for ignition period of (7) seconds, the ignition Module will stop the ignition sequence and the gas valve will be turned off. The ignition module will go through this sequence three (3) times, if full ignition fails after the third try, the module will go to full lock out. To restart the ignition sequence, turn the main electrical power off to the heater, using the switch on the bottom of the junction box, for a period of one minute, then turn the power back on, the heater will again try to light.

FLAME FAILURE—RE-IGNITION
If the established flame signal is lost while the burner is operating, the control will respond within 1 second. The gas valve is de-energized and the control starts a new ignition sequence in an attempt to relight the burner. If the burner does not relight, the control will go into lockout, requiring a manual reset.
MAINTENANCE INSTRUCTIONS

It is recommended that you check the following items at least every six months and at the beginning of every swimming season.

1. Examine the venting system. Make sure there are no obstructions in the flow of combustion and ventilation air.
2. Visually inspect the main burner and the hot surface ignitor. The normal color of the flame is blue. When flame appears yellow, burners should be inspected and cleaned. Check ignitor for damage.
3. Keep the heater area clear and free from combustibles and flammable liquids.

ENERGY SAVING TIPS

1. If possible, keep pool or spa covered when not in use. This will not only cut heating costs, but also keep dirt and debris from settling in the pool and conserve chemicals.
2. Reduce the pool thermostat setting to 78° F. or lower. This is accepted as being the most healthy temperature for swimming by the American Red Cross.
3. Use an accurate thermometer.
4. When the proper maximum thermostat settings have been determined, tighten the thermostat knob stopper.
5. Set time clock to start circulation system no earlier than daybreak. The swimming pool loses less heat at this time.
6. For pools that are only used on the weekends, it is not necessary to leave the thermostat set at 78° F. Lower the temperature to a range that can be achieved easily in one day. Generally, this would be 10° F. to 15° F., if pool heater is sized properly.
7. During the winter or while on vacation, turn the heater off.
8. Set up a regular program of preventative maintenance for the heater each new swimming season. Check heat exchanger, controls, burners, operation, etc.

SPRING AND FALL OPERATION

If the pool is being used occasionally, do not turn the heater completely off. Set the thermostat down to 65° F. This will keep the pool and the surrounding ground warm enough to bring the pool up to a comfortable swimming temperature in a shorter period of time.

WINTER OPERATION

If the pool won’t be used for a month or more, turn the heater off at the main gas valve. For areas where there is no danger of water freezing, water should circulate through the heater all year long, even though you are not heating your swimming pool. The MiniMax NT should not be operated outdoors at temperatures below 0° F. for propane and -20° F. for natural gas. Where freezing is possible, it is necessary to drain the water from the heater. This may be done by opening the drain valve, located at the inlet/outlet header (see Figure 23.), allowing all water to drain out of the heater. It would be a good practice to use compressed air to blow the water out of the heat exchanger. (See additional notes under Important Notices in Introduction.)
CHEMICAL BALANCE

POOL AND SPA WATER

Your Pentair Pool Products pool heater was designed specifically for your spa or pool and will give you many years of trouble-free service, provided you keep your water chemistry in proper condition.

Three major items that can cause problems with your pool heater are: improper pH, disinfectant residual, and total alkalinity. These items, if not kept properly balanced, can shorten the life of the heater and cause permanent damage.

RULE: 7.4 to 7.6 is a desirable pH range. It is essential to maintain correct pH, see Table 6.

If pH becomes too high (over alkaline), it has these effects:

1. Greatly lowers the ability of chlorine to destroy bacteria and algae.
2. Water becomes cloudy.
3. There is more danger of scale formation on the plaster or in the heat exchanger.
4. Filter elements may become blocked.

If pH is too low (over acid) the following conditions may occur:

1. Excessive eye burn or skin irritation.
2. Etching of the plaster.
3. Corrosion of metal fixtures in the filtration and recirculation system, which may create brown, blue, green, or sometimes almost black stains on the plaster.
4. Corrosion of copper in the heater, which may cause leaks.
5. If you have a sand and gravel filter, the alum used as a filter aid may dissolve and pass through the filter.

CAUTION: Do not test for pH when the chlorine residual is 3.0 ppm or higher, or bromine residual is 6.0 ppm or higher. See your local pool supply store for help in properly balancing your water chemistry.

RULE: Chemicals that are acid lower pH. Chemicals that are alkaline raise pH.

WHAT A DISINFECTANT DOES

Two pool guests you do not want are algae and bacteria. To get rid of them and make pool water sanitary for swimming - as well as to improve the water's taste, odor and clarity - some sort of disinfectant must be used. Chlorine and bromine are universally approved by health authorities and are accepted disinfecting agents for bacteria control.

WHAT IS A DISINFECTANT RESIDUAL?

When you add chlorine or bromine to the pool water, a portion of the disinfectant will be consumed in the process of destroying bacteria, algae and other oxidizable materials. The disinfectant remaining is called chlorine residual or bromine residual. You can determine the disinfectant residual of your pool water with a reliable test kit, available from your local pool supply store.

You must maintain a disinfectant residual level adequate enough to assure a continuous kill of bacteria or virus introduced into pool water by swimmers, through the air, from dust, rain or other sources.

It is wise to test pool water regularly. Never allow chlorine residual to drop below 0.6 ppm (parts per million). The minimum level for effective chlorine or bromine residual is 1.4 ppm.

pH - The term pH refers to the acid/alkaline balance of water expressed on a numerical scale from 0 to 14. A test kit for measuring pH balance of your pool water is available from your local pool supply store; see Table 5.

Table 5.  pH Chart

</thead>
<tbody>
<tr>
<td>0 1 2 3 4 5 6 7 8 9 10 11 12 13 14</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Muriatic Acid has a pH of about 0. Pure water is 7 (neutral). Weak Lye solution have a pH of 13-14.

ALKALINITY High - Low:

"Total alkalinity" is a measurement of the total amount of alkaline chemicals in the water, and control pH to a great degree. (It is not the same as pH which refers merely to the relative alkalinity/acidity balance.) Your pool water's total alkalinity should be 100 - 140 ppm to permit easier pH control.

A total alkalinity test is simple to perform with a reliable test kit. You will need to test about once a week and make proper adjustments until alkalinity is in the proper range. Then, test only once every month or so to be sure it is being maintained. See your local pool dealer for help in properly balancing the water chemistry.

Note: Parts for ASME and high altitude are not listed above, please contact our Customer Service Department for details.
MiniMax® NT Heaters
Limited Warranty

Your MiniMax® NT pool heater is another quality product from Pentair Pool Products, Inc. and is backed by the following warranty.

1. The following parts are warranted for 5 years from date of purchase:
   The MiniMax NT cabinet and combustion chamber, the main burners and burner manifold, the inlet/outlet header and the return header. This warranty does not cover rusting or corrosion on cabinets or burners that does not affect the heater's operation.

2. The following parts are covered for 2 years from date of purchase:
   The automatic flow control valve, all controls, heat exchanger, pilot generator and the pilot assembly.

This warranty only applies to the original purchaser.

3. This warranty shall not apply to any units or parts which have been subject to accident, negligence, alteration, abuse, misapplication or misuse.

The above warranty applies only if the heater is installed and operated in complete compliance with the installation and operation manual provided with each unit. Copies of this manual are available by writing to Pentair Pool Products, Inc., at the address below.

Pentair Pool Products, Inc. assumes no liability except for the repair or replacements of parts as specified above. Ship defective parts or equipment along with serial number and purchase date, transportation prepaid to the address below. Purchaser shall be responsible for freight charges for return of merchandise to purchaser. Some states do not allow exclusion or limitation of incidental or consequential damages so the above may not apply to you.

This warranty gives you specific legal rights, and you may also have other rights which vary from state to state.
